various food processing operations. Mechanical processing equipment such as size reduction, size enlargement, homogenization, and mixing are discussed. Mechanical separations equipment such as filters, centrifuges, presses, and solids/air systems, plus equipment for industrial food processing such as heat transfer, evaporation, dehydration, refrigeration, freezing, thermal processing, and dehydration, are presented. Equipment for novel food processes such as high pressure processing, are discussed. The appendices include conversion of units, selected thermophysical properties, plant utilities, and an extensive list of manufacturers and suppliers of food equipment.

Methods for processing of biological materials into useful products represent essential core manufacturing activities of the food, chemical and pharmaceutical industries. On the one hand the techniques involved include well established process engineering methodologies such as mixing, heat transfer, size modification and a variety of separation and fermentation procedures. In addition, new bioprocessing practices arising from the exciting recent advances in biotechnology, including innovative fermentation cell culture and enzyme based operations, are rapidly extending the frontiers of bioprocessing. These developments are resulting in the introduction to the market place of an awesome range of novel biological products having unique applications. Indeed, the United States Office of Technology Assessment has concluded that 'competitive advantage in areas related to biotechnology may depend as much on developments in bioprocess engineering as on innovations in genetics, immunology and other areas of basic science'. Advances in analytical instrumentation, computerization and process automation are playing an important role in process control and optimization and in the maintenance of product quality and consistency characteristics. Bioprocessing represents the industrial practice of biotechnology and is multidisciplinary in nature, integrating the biological, chemical and engineering sciences. This book discusses the individual unit operations involved and describes a wide variety of important industrial bioprocesses. All institutions require a framework of governance, comprising a mission to be accomplished with clear rules and recognized conventions to guide its accomplishment. This book sets the governance of companies - corporate governance - in a wider framework so that it can be appreciated as part of a long tradition and of a system that affects our lives at all levels and in most places. Corporate governance is no longer optional for businessmen - it is vital - and the events which have led to this and the approaches taken by different countries are explained by Adrian Davies. He goes on to develop a working model for introducing a system of corporate governance, as well as detailing the process of installing and maintaining it. As the title suggests, A Strategic Approach to Corporate Governance explores the link between corporate governance and business strategy, and examines the role of the board of directors in providing leadership to both processes. Moving beyond the Cadbury, Greenbury and Hampel Codes, this book outlines a stakeholder approach to corporate governance which complements the financially-focused Codes. As Sir Adrian Cadbury says in his Foreword: 'Openness and accountability are the governance watchwords and ethical standards are the basis on which lasting governance systems are built. These are the lessons we have all learnt from the work which

has been done worldwide on the governance of companies. Adrian Davies' book will, with advantage, help to spread corporate experience in this field to a wider range of organisations.'

Concern for the environment has become one of the big issues in modern society, and one of the chief concerns is the environmental impact of modern industrial production. A particularly sensitive issue is the possibility of accidents in industries where there may be severe consequences for people, property and the environment. At one time the nuclear industry was seen as the most likely to be the cause of significant environmental damage, but after the occurrence of several major accidents such as Seveso, Flixborough and Bhopal, that concern extends to much of the chemicals industry. Pressure from society, reflected by strong legislation, coupled with a greater understanding of the impact that chemical processing operations can have, has led to the adoption of higher profile safety and environmental management programs within the chemical industry. Under these programmes existing and new processes are rigorously examined to determine the possible causes and consequences of failure, and the results used to improve the process to make failure less likely. Any process audit, aimed at improving safety or lessening the environmental impact, cannot be carried out using intuition or experience alone, so the discipline of risk analysis has grown as a collection of tools and methods which can be utilized to give a quantitative assessment of the risks involved in operating any given process. In this new book the authors present risk analysis and reduction in a clear and unified way, emphasizing the various

different methods which can be used together in a global approach to risk analysis in the chemical process industries. Originally conceived as a text book for graduate level courses in chemical engineering, the clear presentation and thorough coverage will ensure that anyone involved in risk assessment, environmental impact assessment or safety planning will find this book an invaluable source of reference.
